## The RIKILT method to detect toxins in seafood

Toxins in seafood are harmful to human health. Therefore, it is of utmost importance to detect them. Current methods to test toxins in seafood cost hundreds of thousands of mice annually worldwide. In the Netherlands, we do not use mice, but an analytical method, although it cannot detect all toxins yet. Therefore, as an alternative, RIKILT uses a cell based effect assay. This test is inexpensive, efficient, animal friendly, and offers the consumer, ultimately, more safety.

Discover how we do this

# “Democratizing”\* spectroscopy

● Lab  
(20-50k€)

● Portable  
(5-20k€)

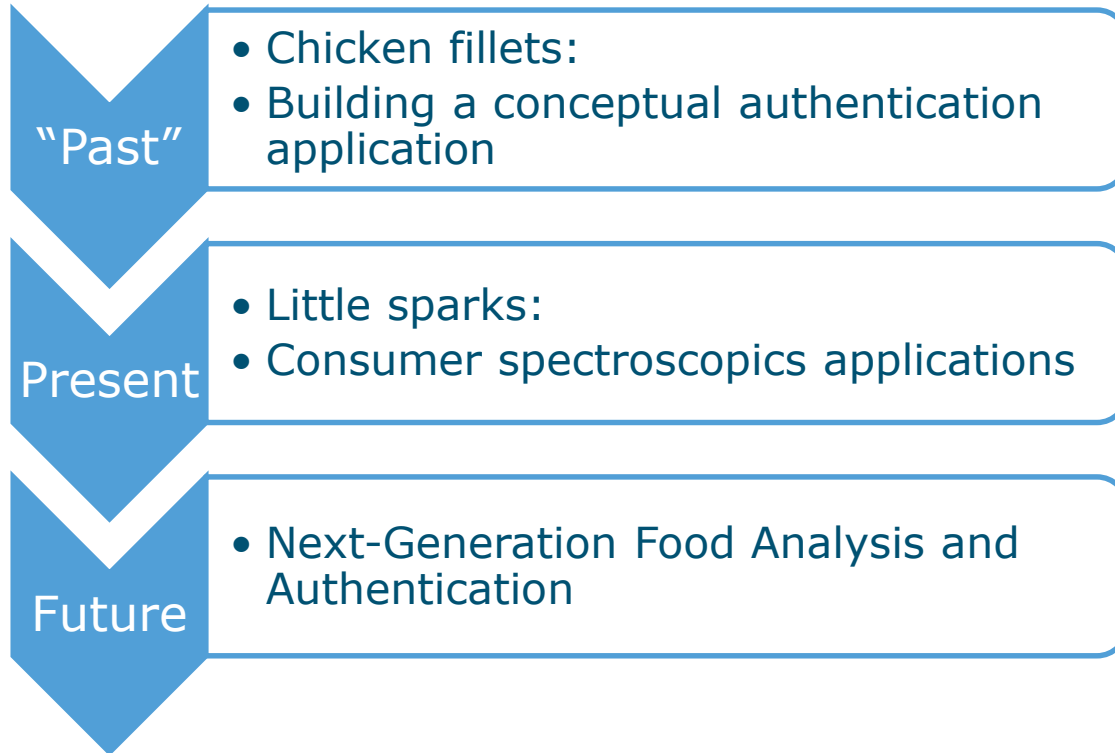

● Consumer  
0.2-2k€

**Q & A**

Past - Case Study: Chicken fillets

**Macro component:** Moisture/Protein

**Micro component:** Chilled vs. Thawed

# Increase in animal welfare awareness

## Basiskip

- leeft 35-45 dagen
- groeit 60-65 gram per dag
- 21 kippen per m<sup>2</sup>
- Geen natuurlijk daglicht

'Basic' chick  
€ 5 – 7 / kg

## Nieuwe Standaard Kip

- leeft 49 dagen
  - groeit 45 gram per dag
  - 13,5 kippen per m<sup>2</sup>
  - Natuurlijk daglicht
- + €1 p/kg  
1.0v. Basiskipfiet

'New standard' chick  
€ 6 – 9 / kg

## Scharrelkip

- leeft 56 dagen
- groeit 45 gram per dag
- 12 kippen per m<sup>2</sup>
- Overdekte uitloop

'Free range' chick  
€ 11 – 13 / kg

## Biologische Kip

- leeft 70-81 dagen
- groeit 30-40 gram per dag
- 10 kippen per m<sup>2</sup>
- Vrije uitloop

'Biological' chick  
€ 25 – 27 / kg

# Sample plan

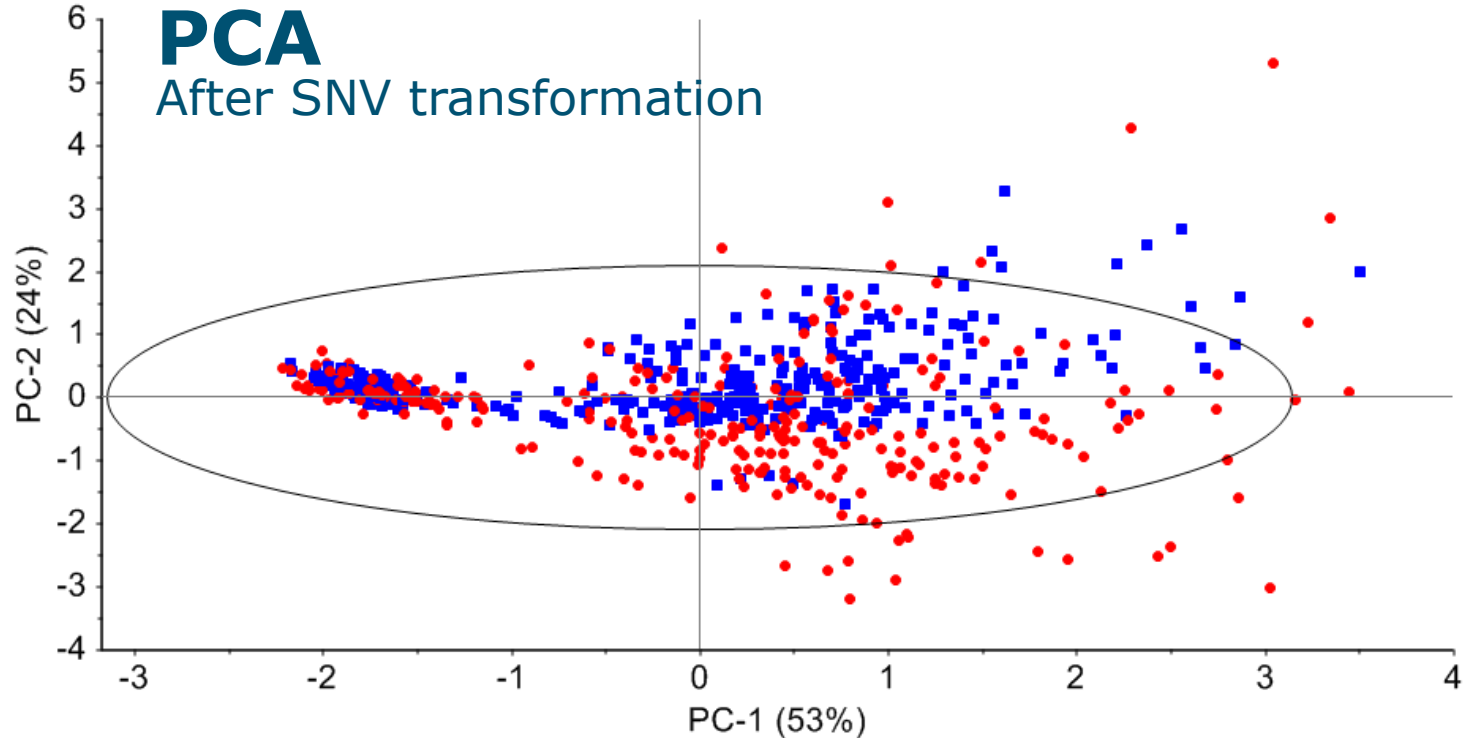

Reference methods for:

- “Freshness” (in-house HADH method)
- Moisture content
- Protein content

# How to 'teach' your scanner

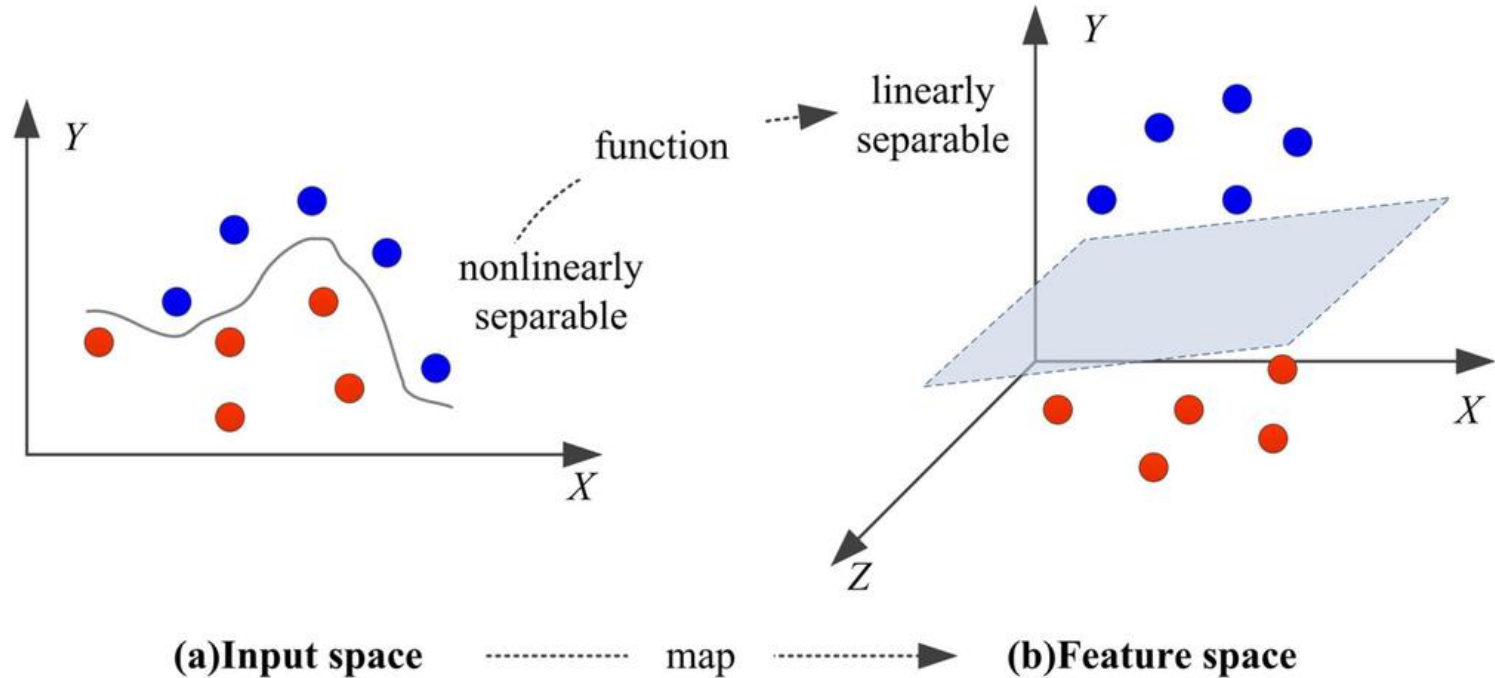

# Spectroscopic data is relatively chaotic

■ Chill ● Thaw

# Machine learning: e.g. Support vector machine

# Moisture-Protein ratio by machine learning

Predicted as:  
**Chilled**

**Thawed**

# Lessons learned from the fillet case

- Moisture and protein regression promising
- 95% correct prediction of chilled products and 80% for thawed products → In the lab!
- Transferability outside lab?
- How do you cover all chicken meat in the world?
- Relatively expensive scanners for an authenticity problem
- NIR has limitations! Realistic expectations

# Present: Consumer spectroscopics

## Spectroscopic analysis

Short-wavelength near  
infrared (SW-NIR)  
750-1059 nm

## Smartphone

Easy to use

Time:  $\approx$  5 sec

## Modelling

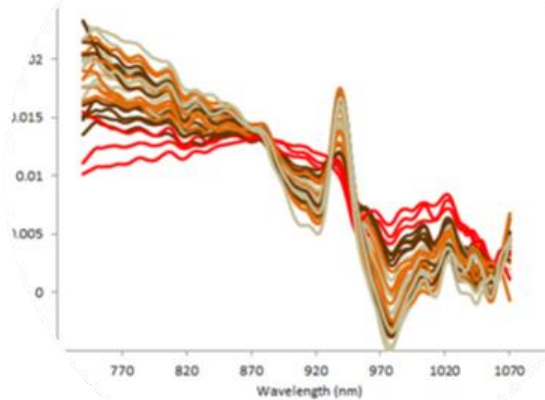

### Classification

*To which of the defined  
classes does the sample  
belong?*

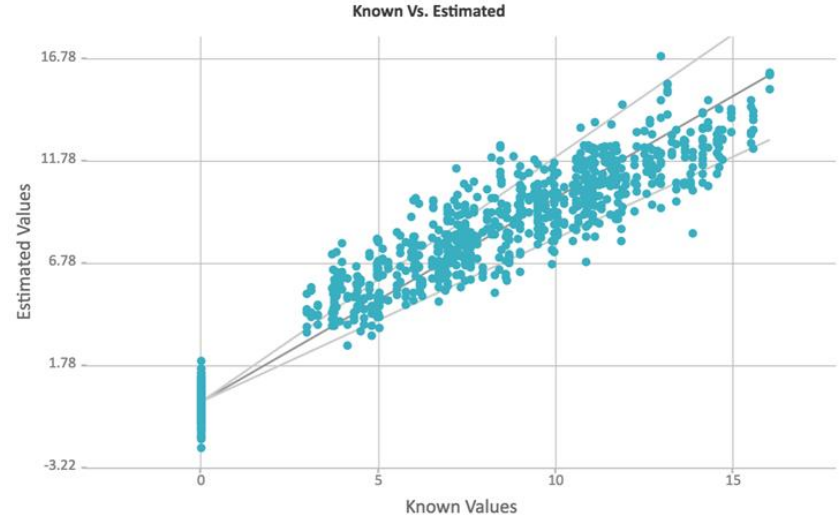

### Estimation

*What is the concentration  
of  $x$  in the sample?*

# Powders: Adulteration of ground nutmeg

# Frozen produce: Fish Glaze

Pilot: Accuracy approximately 3%

# Liquids: Distilled spirits

# Scan je schnitzel

Kan ik die melk nog drinken? Bevat dit koekje gluten? En hoeveel calorieën zitten er in dit stuk taart? Met een handzame voedselscanner zou je die vragen zelf kunnen beantwoorden.

duurt het uren, dagen of weken voordat je een uitslag hebt. Als je de analyse ter plekke kunt doen, dan kun je direct ingrijpen als er iets mis is, zegt Nislen. Dat is handig, als je een partij vlees vindt waarmee gesjeurd is. Zoals het nu gaat, is de partij al lang verwerkt voordat je dit resultaat hebt.
